Japanese alignment decoy set (ja_JP) — answer key

Ingest file: `output/json/ja_JP.json` · audio: `output/wav/ja_0001.wav … ja_0025.wav`. Keep this away from the inspectors. **25** files: **18** clean, **7** with **48** injections · **5** synthetic voice (whole-audio tag `synthetic_speech`), **20** human-sounding.

Every item in the ingest file has a segment `start/end` (the playing area). In clean files it runs exactly from the first word's start to the last word's end. Because the aligner re-aligns words on ingest, boundary mismatches are also planted on the segment edges (SB-START / SB-END), which it cannot re-align.

Injection families

Family	Name	detect	Meaning	Count
SB-START	Segment start moved	SEGMENT_BOUNDARY_MISMATCH	the segment (playing area) starts earlier or later than the speech	7
SB-END	Segment end moved	SEGMENT_BOUNDARY_MISMATCH	the segment (playing area) ends earlier or later than the speech	7
WB-SHIFT	Word boundary moved	WORD_BOUNDARY_MISMATCH	a word's start or end is before the word starts, inside it, or past its end	17
WB-CUT	Word cut off	WORD_CUT_OFF	a word's end is placed in the middle of the word	4
WS-SUB	Incorrect transcription	WORD_AT_SLOT_SUBSTITUTED	the word is spoken, but the transcript says a different word	6
WD	Missing segment	WORD_AT_SLOT_PRESENT	the word is spoken, but has no segment and is not in the transcript	4
WH	Hallucinated segment	WORD_AT_SLOT_ABSENT	a word and segment for something never spoken	3
